《并行程序设计》 实验报告

学号: 201936380086

姓名: 陈涵

班级: 2019 级软件工程 1 班

华南理工大学本科实验报告

课程名称	并行	程序设计		成绩评定	
实验项目	名称 OpenMP 环境	竟配置及实现	见所给算法	的 OpenMP 并	行化
指导教师_	汤德佑		、验地点	B7-333	
学生姓名_	陈涵	学号		201936380086	
学院	软件学院	系_	软件工程	专业	
实验时间_	年月日	午~月	日午		

- 1、实验目标
 - (1) 在 Clang/G++环境下配置 OpenMP 环境;
 - (2) 对以下算法利用 OpenMP 实现并行化。
 - i. 矩阵-向量乘法;
 - ii 字符串分组算法:
- 2、串行程序代码(串行程序已经给出,请把主要代码部分摘抄在下面)

```
i. 矩阵-向量乘法
/*-----
 * Function:
            Mat_vect_mult
 * Purpose:
             Multiply a matrix by a vector
 * In args: A: the matrix
                x: the vector being multiplied by A
                m: the number of rows in A and components in y
                n: the number of columns in A components in x
 * Out args:
            y: the product vector Ax
void Mat vect mult(
                     double A[] /* in */,
                     double x[] /* in */,
                     double y[] /* out */,
                     int
                             m /* in */,
                     int
                             n
                                 /* in */) {
   int i, j;
   for (i = 0; i < m; i++) {
      y[i] = 0.0;
      for (j = 0; j < n; j++)
```

```
y[i] += A[i*n+j]*x[j];
}
} /* Mat_vect_mult */
```

```
ii 字符串分组算法(比较哈希方法和排序方法)
//group strings with hash in unordered_map STL
std::unordered_map<std::string, int> work_hash(std::vector<std::string> &origin)
     std::unordered map<std::string, int> final ans;//for final answer
     for(auto &s:origin)
     {
         //put string into hash table
         if(final_ans.find(s) == final_ans.end())
              final ans[s] = 1;
          else
              final ans[s]++;
     return final_ans;
}
//group strings with sort
std::vector<std::pair<std::string, int> >
      work_sort_multithread(std::vector<std::string> &origin)
{
     std::vector<std::pair<std::string, int> > final_ans_sort;//for final answer
     std::sort(origin.begin(), origin.end());
     //write answer into vector
     std::string str="\0";
     int cnt=0;
     for(auto &s:origin)
          if(str == s)
              cnt++;
          else
         {
              if(str != "\0")
                   final_ans_sort.push_back(std::make_pair(str, cnt));
              str = s;
              cnt = 1;
         }
     }
     if(str != "\0")
```

```
final_ans_sort.push_back(std::make_pair(str, cnt));
  return final_ans_sort;
}
```

3、并行程序关键代码

```
i. 矩阵-向量乘法
 * Function: Mat_vect_mult
 * Purpose: Multiply a matrix by a vector
 * In args: A: the matrix
                 x: the vector being multiplied by A
                 m: the number of rows in A and components in y
                 n: the number of columns in A components in x
 * Out args: y: the product vector Ax
 */
void Mat_vect_mult(
                      double A[] /* in */,
                      double x[] /* in */,
                      double y[] /* out */,
                                   /* in */,
                      int
                              m
                                    /* in */) {
                      int
                              n
   int i, j;
   #pragma omp parallel for num_threads(N)
   for (i = 0; i < m; i++) {
       y[i] = 0.0;
       for (j = 0; j < n; j++)
          y[i] += A[i*n+j]*x[j];
} /* Mat vect mult */
```

ii 字符串分组算法

```
代码段 1(直接分段排序)
```

```
int one part = origin.size()/N;
int split edge[2*(N+1)];
split_edge[0]=0;
split_edge[N]=origin.size();
for(int i=N+1;i<2*(N+1);i++)
{
    split_edge[i]=split_edge[N];
}
for(int i=1;i<N;i++)</pre>
{
    split edge[i] = split edge[i-1] + one part;
}
//parallel sort
#pragma omp parallel for num_threads(N)
for(int i=0;i<N;i++)</pre>
    sort(origin.begin()+split_edge[i], origin.begin()+split_edge[i+1]);
}
//merge
for(int merge_size=1;merge_size<N;merge_size*=2)</pre>
{
    #pragma omp parallel for num_threads(N)
    for(int i=0;i<N;i+=2*merge_size)</pre>
    {
          std::vector<std::string> temp1(origin.begin()+split_edge[i],
                      origin.begin()+split edge[i+merge size]);
          std::vector<std::string>
                      temp2(origin.begin()+split_edge[i+merge_size],
                      origin.begin()+split_edge[i+2*merge_size]);
          merge(temp1.begin(), temp1.end(), temp2.begin(), temp2.end(),
                      origin.begin()+split edge[i]);
    }
}
//write answer into map
std::string str="\0";
int cnt=0;
for(auto &s:origin)
{
    if(str == s)
     {
          cnt++;
```

```
}
          else
          {
               if(str != "\0")
                     final ans sort.push back(std::make pair(str, cnt));
               str = s;
               cnt = 1;
          }
     }
     if(str != "\0")
          final_ans_sort.push_back(std::make_pair(str, cnt));
     return final ans sort;
代码段 2(按首字母分组排序)
//group strings with split by prefix then sort multi-thread
std::vector<std::pair<std::string, int> >
       work prefix sort multithread(std::vector<std::string> &origin)
{
     //split by prefix-one char
     std::vector<std::string> origin_split[N];
     for(auto &s:origin)
     {
          origin_split[s[0]%N].push_back(s);
     }
     //parallel sort
     #pragma omp parallel for num_threads(N)
     for(int i=0;i<N;i++)
     {
          sort(origin_split[i].begin(), origin_split[i].end());
     }
     std::vector<std::pair<std::string, int> > final ans prefix sort;//for final answer
     final ans prefix sort.reserve(origin.size());
     //write answer into map
     std::string str="\0";
     int cnt=0;
     for(int i=0;i<N;i++)</pre>
     {
          if(origin_split[i].empty()) continue;
```

```
for(auto &s:origin_split[i])
          {
               if(str == s)
               {
                    cnt++;
               }
               else
               {
                    if(str != "\0")
                    {
                         final ans prefix sort.push back(std::make pair(str, cnt));
                    str = s;
                    cnt = 1;
               }
          }
     }
     if(str != "\0")
     {
          final_ans_prefix_sort.push_back(std::make_pair(str, cnt));
     }
     return final_ans_prefix_sort;
}
代码段 3 (哈希分组)
//group strings with hash multi-thread
std::unordered map<std::string, int>
       work_hash_multithread(std::vector<std::string> &origin)
{
     std::unordered_map<std::string, int> hashTable_split[N];//for each thread
     std::unordered map<std::string, int> final ans hash;//for final answer
     //split by N threads
     //each thread process in[split_edge[i], split_edge[i+1])
     int one_part = origin.size()/N;
     int split_edge[N+1];
     split_edge[0]=0;
     split edge[N]=origin.size();
     for(int i=1;i<N;i++)</pre>
     {
          split_edge[i] = split_edge[i-1] + one_part;
     }
     //parallel group
```

```
#pragma omp parallel for num_threads(N)
     for(int i=0;i<N;i++)</pre>
           hashTable_split[i].reserve(split_edge[i+1]-split_edge[i]);
          for(int j=split_edge[i];j<split_edge[i+1];j++)</pre>
          {
                if(hashTable split[i].find(origin[j]) == hashTable split[i].end())
               {
                     hashTable_split[i][origin[j]] = 1;
                }
               else
                     hashTable_split[i][origin[j]]++;
                }
          }
     }
     //merge
     //final_ans_hash.reserve(origin.size());
     for(int i=0;i<N;i++)</pre>
          final_ans_hash.insert(hashTable_split[i].begin(), hashTable_split[i].end());
     }
     return final_ans_hash;
代码段 4(首字母分片二维哈希分组)
std::vector<std::unordered_map<std::string, unsigned int> > hash_split[63];
     void work()
     {
          for(unsigned int i=0;i<63;i++)
          {
                hash split[i].resize(thread using);
          }
          //read file into buffer
          std::ifstream fin(input_filename, std::ios::binary);
          if(fin.is open()==false)
          {
                std::cout<<"Fail to open the file!\n";
                return;
          }
          std::vector<char> buf(fin.seekg(0, std::ios::end).tellg());
           fin.seekg(0, std::ios::beg).read(&buf[0],
                     static cast<std::streamsize>(buf.size()));
```

```
if(buf[buf.size()-1]!='\n') buf.push_back('\n');
fin.close();
//split buffer into N parts
uint64_t split_part[thread_using+1];
split part[0]=0;
split_part[thread_using]=buf.size();
uint64_t each_part=buf.size()/thread_using;
for(unsigned int i=1;i<thread_using;i++)</pre>
{
     split part[i]=split part[i-1]+each part;
}
for(unsigned int i=1;i<thread_using;i++)</pre>
{
     while(buf[split part[i]]!='\n')
     {
          split_part[i]++;
     }
}
//multicore-hashing
#pragma omp parallel for num threads(thread using)
for(unsigned int i=0;i<thread_using;i++)</pre>
{
     std::string tmp;
     tmp.clear();
     for(uint64 t idx=split part[i];idx<split part[i+1];idx++)</pre>
     {
          if(buf[idx]=='\n')
          {
                               if(hash split[table ctoi[tmp[0]]][i].find(tmp)=
                               =hash_split[table_ctoi[tmp[0]]][i].end())
               {
                     hash_split[table_ctoi[tmp[0]]][i][tmp]=1;
               }
               else
               {
                     hash_split[table_ctoi[tmp[0]]][i][tmp]++;
               }
               tmp.clear();
          }
          else
```

```
{
               tmp.push_back(buf[idx]);
          }
     }
}
buf.clear();
buf.shrink_to_fit();
//merge
#pragma omp parallel for num_threads(thread_using)
for(unsigned int i=0;i<63;i++)
{
     for(unsigned int t=1;t<thread_using;t++)</pre>
          for(auto &it:hash_split[i][t])
          {
               if(hash_split[i][0].find(it.first)==hash_split[i][0].end())
               {
                    hash_split[i][0][it.first]=it.second;
               }
               else
               {
                     hash_split[i][0][it.first]+=it.second;
               }
          }
     }
}
```

4、性能分析

测试环境1			
CPU	Intel 9880H 8-core 2.3GHz		
Memory	DDR4-2400MHz Dual-Channel 32GB		
compiler	Apple Clang-1300.0.29.30		
disk	APPLE SSD AP2048M-2TB@PCIe 3.0 x4		

测试环境 2				
CPU	AMD Ryzen 7 5700G 8-core 4.6GHz			
Memory	DDR4-4533MHz Dual-Channel 32GB			
compiler	G++-4.8.1(tdm64-2)			
disk	Sansumg PM9A1-1TB@PCIe 3.0 x4			

低中高词频测试数据集(根据助教提供的代码和参考参数生成)					
20M_low.txt	20M_mid.txt	20M_high.txt			
20000000 1 5	20000000 1 15	20000000 1 50			

4.1 比较直接分段快速排序后归并和按首字符分组后排序

测试环境	使用代码	数据集	直接分段排序	分组排序
测试环境1	代码段 1、2	20M mid.txt	simple sort	prefix split sort

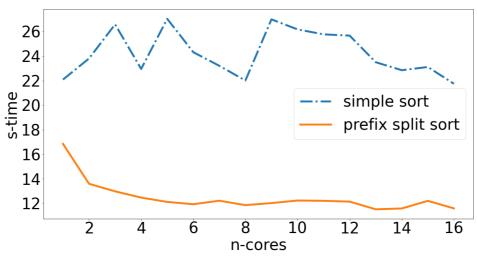

图 1 直接分段快速排序后归并和按首字符分组后排序用时对比

由于直接分段排序后,归并和去重部分只能串行处理,导致并行部分占比不高,用时远高于分组排序。同时直接分段排序在归并时采取两两归并的策略,在 2 的次幂线程数下用时低于其他线程数。

4.2 比较哈希分组和按首字母分组后排序

测试环境	使用代码	数据集	哈希方法	分组排序
测试环境1	代码段 1、3	20M_low.txt	hash	split sort

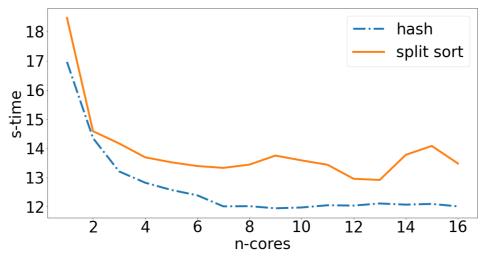

图 2 哈希分组和按首字母分组排序用时对比

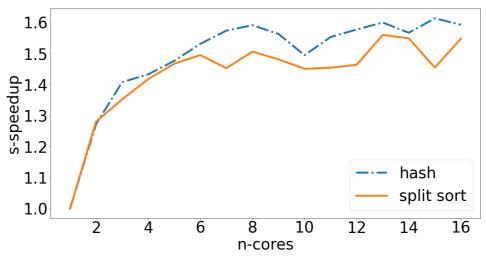

图 3 哈希与按首字母分组排序加速比对比

由于哈希不需要按首字母分组,减小了串行部分。同时,哈希方法不会重复储存相同的字符串,减小了内存开支,提高了缓存命中率和访存速度。可以猜测,哈希方法在高词频的数据集上会产生更好的效果。

由于测试环境1是笔记本,在高负载下会出现一定程度的降频,导致测试数据不稳定,接下来将在稳定环境下测试。

4.3 比较哈希分组在不同词频数据集下的效果

测试环境	使用代码	数据集	方法
测试环境 2	代码段 3	20M low.txt, 20M mid.txt, 20M high.txt	hash

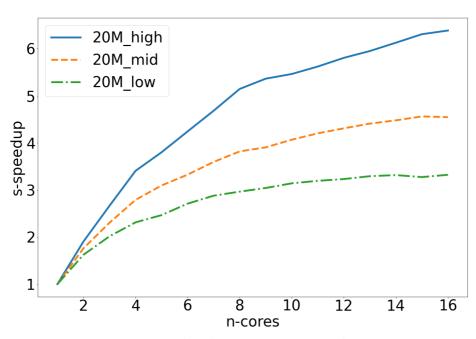

图 4 比较哈希分组在不同词频下加速比

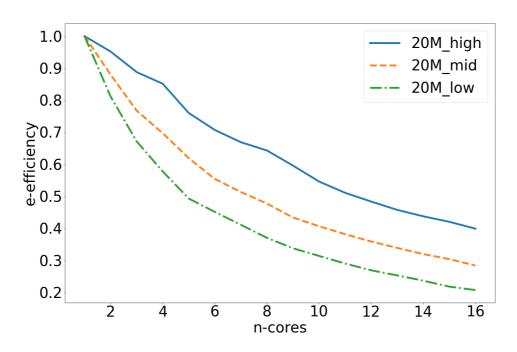

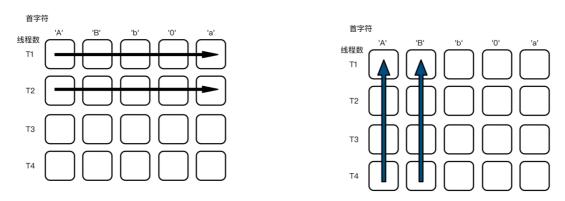

图 5 哈希方法在不同词频下的效率

在高词频情况下,哈希方法不重复储存相同的字符串,减小了内存开支,提高了 缓存命中率和访存速度。实现了约低词频下两倍的加速比。

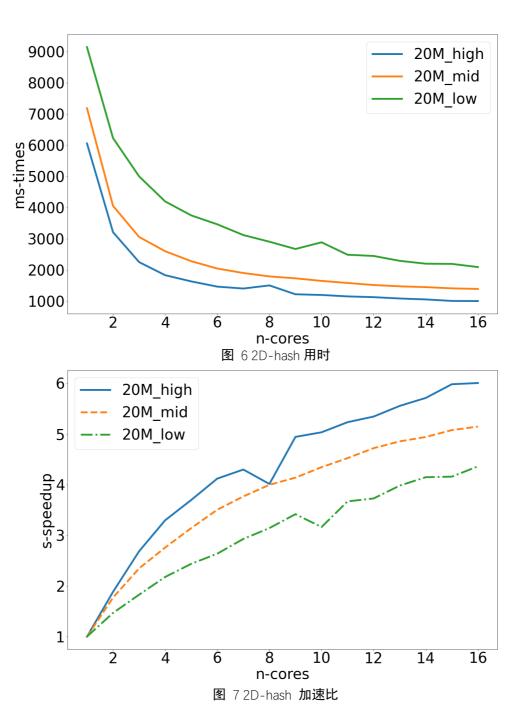

4.4 二维分组哈希

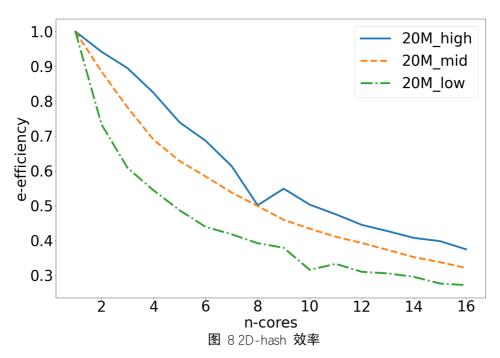

当前的哈希方法,仍然在合并多个线程的哈希表时存在大量串行部分,我们采取 按操作线程和首字母分块的二维哈希方法。

如图所示,我们先直接将读入分成线程个数,每个线程内部对 62 种首字符情况 开辟哈希表,按线程数哈希分组。然后我们对每个线程创建的某个首字符的哈希 表进行并行的合并,最后实现哈希和合并都以并行处理。

测试环境	使用代码	数据集	方法
测试环境 2	代码段 4	20M_low.txt, 20M_mid.txt, 20M_high.txt	2D-hash

在该方法下,并行效率进一步提高,低词频下加速比从原方法的 3.3 提升到 4.5。但是在高频 8 线程和低频 10 线程情况下均出现性能较大衰减,踩车是由于按该线程数分组后出现余数较大并且发生较多哈希碰撞的影响。但总体而言已经实现了较高的并行效率。

5、总结

经过本次实验,我大致了解了 openmp 在并行处理中的使用方法,感受到了分组策略对并行处理效率提升的影响,同时比较了哈希和排序等算法在去重操作中的优缺点。
